## 3-ARYLOXY-3-SUBSTITUTED PROPANAMINES

This invention relates to novel 3-aryloxy-3-substituted propanamines, and to their use in inhibiting serotonin and norepinephrine uptake.

During the past decade, the relationship between monoamine uptake and a variety of diseases and conditions has been appreciated and investigated. For example, the hydrochloride salt of fluoxetine (dl -N-methyl- $\gamma$ -[4-(trifluoromethyl)phenoxy]benzenepropanamine) is a selective and specific serotonin (5-hydroxytryptamine) uptake inhibitor presently undergoing clinical evaluation for the treatment of depression, anxiety, appetite suppression, and other disorders. Similarly, tomozetine hydrochloride ((-)-N-methyl- $\gamma$ -(2-methylphenoxy)benzenepropanamine hydrochloride) is a selective and specific inhibitor of norepinephrine uptake being investigated clinically for its antidepressant activity. These compounds are among many taught in U.S. Patents Number 4,018,895, 4,194,009, and 4,314,081 as being potent but selective blockers of the uptake of one particular monoamine inhibitor.

The present invention provides novel 3-aryloxy-3-substituted propanamines which are potent inhibitors of both serotonin and norepinephrine uptake.

According to the present invention there is provided a compound of the formula

wherein:

R<sup>1</sup>: is C<sub>5</sub>-C<sub>7</sub> cycloalkyl, thienyl, halothienyl, (C<sub>1</sub>-C<sub>4</sub> alkyl)thienyl, furanyl pyridyl or thiazolyl;

each of R<sup>2</sup> and R<sup>3</sup> independently is hydrogen or methyl;

each R<sup>4</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>3</sub> alkoxy or trifluoromethyl;

each R<sup>5</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl or trifluoromethyl;

m is 0, 1 or 2;

n is 0 or 1; and

the pharmaceutically acceptable acid addition salts thereof.

The invention also provides pharmaceutical formulations comprising a compound of the above formula and a pharmaceutically acceptable carrier, diluent or excipient therefor.

A further embodiment of the invention are methods for selectively inhibiting the uptake of serotonin and norepinephrine, as well as for treating a variety of disorders which have been linked to decreased neurotransmission of serotonin and norepinephrine in mammals including obesity, depression, alcoholism, pain, loss of memory, anxiety, smoking, and the like, employing a compound of the invention.

In the above formula, the term C<sub>1</sub>-C<sub>4</sub> alkyl represents a straight or branched alkyl chain bearing from one to four carbon atoms. Typical C<sub>1</sub>-C<sub>4</sub> alkyl groups include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec.-butyl and t-butyl.

C<sub>1</sub>-C<sub>3</sub> Alkoxy represents methoxy, ethoxy, n-propoxy or isopropoxy.

Halo represents fluoro, chloro, bromo or iodo.

When Ar is naphthalenyl, it can be either 1-naphthalenyl or 2-naphthalenyl.

When R<sup>1</sup> is thienyl, it can be either 2-thienyl or 3-thienyl; when R<sup>1</sup> is furanyl, it can be either 2-furanyl or 3-furanyl; when R<sup>1</sup> is pyridyl, it can be either 2-pyridyl, 3-pyridyl or 4-pyridyl; when R<sup>1</sup> is thiazolyl, it can be either 2-thiazolyl, 4-thiazolyl or 5-thiazolyl.

(C<sub>1</sub>-C<sub>4</sub> Alkyl)thienyl represents a thienyl ring monosubstituted with a C<sub>1</sub>-C<sub>4</sub> alkyl substituent. Typical (C<sub>1</sub>-C<sub>4</sub> alkyl)thienyl groups include 4-methyl-2-thienyl, 3-ethyl-2-thienyl, 2-methyl-3-thienyl, 4-propyl-3-thienyl, 5-n-butyl-2-thienyl, 4-methyl-3-thienyl, 3-methyl-2-thienyl, and the like.

Halothienyl represents a thienyl ring monosubstituted with a halo substituent. Typical halothienyl groups include 3-chloro-2-thienyl, 4-bromo-3-thienyl, 2-iodo-3-thienyl, 5-iodo-3-thienyl, 4-fluoro-2-thienyl, 2-bromo-3-thienyl, 4-chloro-2-thienyl and the like.

While all of the compounds of the present invention are believed to inhibit the uptake of serotonin and norepinephrine in mammals, there are certain of these compounds which are preferred for such uses. Preferably, R<sup>1</sup> is halothienyl, (C<sub>1</sub>-C<sub>4</sub> alkyl)thienyl and especially thienyl. Further, one of R<sup>2</sup> and R<sup>3</sup> is hydrogen and the other is methyl. It is also preferred that those compounds wherein both R<sup>2</sup> and R<sup>3</sup> are other than methyl are preferred for inhibiting the uptake of norepinephrine in mammals. Other preferred aspects of the present invention will be noted hereinafter.

The compounds of the present invention possess an asymmetric carbon represented by the carbon atom labeled "C\*" in the following formula:

As such, the compounds can exist as the individual stereoisomers as well as the racemic mixture. Accordingly, the compounds of the present invention will include not only the dl-racemates, but also their respective optically active d-and l-isomers.

As pointed out above, the invention includes the pharmaceutically acceptable acid addition salts of the compounds defined by the above formula. Since the compounds of this invention are amines, they are basic in nature and accordingly react with any number of inorganic and organic acids to form pharmaceutically acceptable acid addition salts. Since the free amines of the invention are typically oils at room temperature, it is preferable to convert the free amines to their corresponding pharmaceutically acceptable acid addition salts, which are routinely solid at room temperature, for ease of handling. Acids commonly employed to form such salts include inorganic acids such as hydrochloric, hydrobromic, hydroiodic, sulfuric and phosphoric acid, as well as organic acids such as para-toluenesulfonic, methanesulfonic, oxalic, para-bromophenylsulfonic, carbonic, succinic, citric, benzoic and acetic acid, and related inorganic and organic acids. Such pharmaceutically acceptable salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, decanoate, caprylate, acrylate, formate, isobutyrate, caprate, heptanoate, propiolate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, terephthalate, sulfonate, xylenesulfonate, phenylacetate, phenylpropionate, phenylbutyrate, citrate, lactate, β-hydroxybutyrate, glycolate, maleate, tartrate, methanesulfonate, propanesulfonates, naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate and the like salts. Preferred pharmaceutically acceptable acid addition salts include those formed with mineral acids such as hydrochloric acid and hydrobromic acid, and especially those formed with organic acids such as oxalic acid and maleic acid.

The following compounds further illustrate compounds contemplated within the scope of the present invention:

- N-Methyl-3-(1-naphthalenyloxy)-3-(3-thienyl)-propanamine phosphate

40 The compounds of the present invention may be prepared by procedures well known to those of ordinary skill in the art. The compounds are preferably synthesized by treating an hydroxy intermediate with an alkali metal hydride to form the corresponding alkali metal salt, which is then reacted with an appropriate compound containing a good leaving group to provide the corresponding 3-aryloxy-3-substituted propanamine of the invention. This reaction may be represented by the following scheme:

wherein M is an alkali metal, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and Ar are as defined above, and one of X and Y is hydroxy and the other is a good leaving group such as p-toluenesulfonyl, methanesulfonyl, triphenylphosphine oxide, halo and the like. Preferably X is hydroxy and Y is halo. The alkali metal hydride may be replaced by other

bases strong enough to generate the anion.

This reaction is carried out by combining approximately equimolar quantities to a slight excess of the alkali metal hydride with the alcohol to provide the corresponding alkali metal salt. Typical alkali metal hydrides include sodium hydride and potassium hydride. The compound is then reacted with an equimolar quantity to slight excess of the compound having the good leaving group. The reaction is conducted in a suitable aprotic solvent such as N,N-dimethylacetamide and related solvents. The reaction is substantially complete after about 10 minutes to about 24 hours when conducted at a temperature in the range of about 25°C to about 150°C. More preferably, the reaction mixture will be complete within about 30 minutes to about 6 hours when conducted at a temperature in the range of about 75°C to about 125°C. The product may be isolated by standard conditions as well. Typically, the mixture is diluted with water and extracted with a water immiscible organic solvent such as diethyl ether, ethyl acetate, chloroform and the like. The organic extracts are typically combined and dried. Following evaporation of the organic solvent the isolated residue may be further purified, if desired, by standard techniques such as crystallization from common solvents, or chromatography over solid supports such as silica gel or alumina.

The compounds of the present invention wherein one of R<sup>2</sup> and R<sup>3</sup> is hydrogen and the other is methyl are preferably prepared by demethylating the corresponding N,N-dimethylpropanamine. Preferably, a reagent such as a phenyl chloroformate or trichloroethyl chloroformate is reacted with the N,N-dimethylpropanamine to provide the corresponding intermediate, which is then hydrolyzed in base to provide the corresponding N-methylpropanamine.

As noted above, the optically active isomers of the racemates of the invention are also considered part of this invention. Such optically active isomers may be prepared from their respective optically active precursors by the procedures described above, or by resolving the racemic mixtures. This resolution can be carried out in the presence of a resolving agent, by chromatography or by repeated crystallization. Particularly useful resolving agents include dibenzoyl-D and -L-tartaric acids and the like.

The compounds employed as starting materials in the synthesis of the compounds of the invention are also prepared by standard procedures. Preferably, standard Mannich reaction conditions are employed to synthesize the corresponding Mannich Base from the appropriate ketone, formaldehyde and dimethylamine, which is then reduced with a hydride reducing agent, such as sodium borohydride, employing standard reduction conditions. The analogs containing the leaving group are also prepared by known procedures or are commercially available from various organic laboratories.

The pharmaceutically acceptable acid addition salts of the invention are typically formed by reacting a 3-aryloxy-3-substituted propanamine of the invention with an equimolar or excess amount of acid. The reactants are generally combined in a mutual solvent such as diethyl ether or benzene, and the salt normally precipitates out of solution within about one hour to 10 days, and can be isolated by filtration.

The following Examples further illustrate the compounds of the present invention and methods for their synthesis. The Examples are not intended to be limiting to the scope of the invention in any respect and should not be so construed.

N-Methyl-3-(1-naphthalenyloxy)-3-(2-thienyl)-propanamine oxalate

25 Phenyl chloroformate (794  $\mu$ l, 0.0063 mol) was added dropwise to a refluxing solution of N,N-dimethyl-3-(1-naphthalenyloxy)-3-(2-thienyl)propanamine (1.79 g, 0.0058 mol) in 100 ml of toluene. The resulting solution was refluxed one and one half hours and cooled to room temperature. The solution was washed (2.5N sodium hydroxide, water, 1N hydrochloric acid, brine), dried over anhydrous sodium sulfate and concentrated in vacuo to give 2.4 g of the crude carbamate. 5N Sodium hydroxide (11.5 ml, 0.058 mol) was  
30 added to a solution of the carbamate (2.4 g, 0.0058 mole) in propylene glycol (100 ml). The mixture was heated at 110°C for 75 minutes. The reaction mixture was diluted with water and extracted with diethyl ether. The organic phase was washed with water and then a saturated sodium chloride solution, dried over anhydrous sodium sulfate, and concentrated under vacuum to yield 1.5 g of an oil. Crystallization of the oil as the oxalate salt from ethyl acetate/methanol gave 920 mg (41.3%) of the title compound as a white  
35 powder. mp = 136°C-138.5°C

## Example 10

## N,N-Dimethyl-3-(4-chloro-1-naphthalenyloxy)-3-(2-thienyl)propanamine oxalate

To a stirred mixture of 4-chloro-1-naphthol (5.36 g, 0.03 mol),  $\alpha$ -[2-(dimethylamino)ethyl]-2-thiophene methanol (5.56 g, 0.03 mol), triphenylphosphine (7.87 g, 0.03 mol) and 75 ml of tetrahydrofuran under a nitrogen atmosphere was added 4.8 ml (0.03 mol) of diethylazodicarboxylate dropwise. Occasional cooling was needed to keep the temperature of the reaction mixture below about 30°C. The resulting solution was stirred at room temperature overnight. The volatile constituents were evaporated under vacuum. The residue was diluted with water and the mixture was basified with 5N sodium hydroxide. The mixture was extracted with diethyl ether, and the organic extracts were washed with water and dried over anhydrous sodium sulfate. Evaporation of the diethyl ether and preparative HPLC of the residue using a silica column with a methylene chloride/methanol mixture as eluant yielded 3.7 g (36% yield) of the pure free base as an oil. The oxalate salt was prepared from the above free base by treating an ethyl acetate solution of the free base with oxalic acid. The resulting precipitate was recrystallized from ethanol to afford colorless crystals. mp = 155°C dec.

## Example 11

## N-Methyl-3-(4-chloro-1-naphthalenyloxy)-3-(2-thienyl)propanamine oxalate

To a stirred solution of N,N-dimethyl-3-(4-chloro-1-naphthalenyloxy)-3-(2-thienyl)propanamine (2.81 g, 8.12 mmol) and 20 ml of toluene heated at 85°C was added dropwise trichloroethyl chloroformate (1.89 g, 8.93 mmol). The stirring was continued at 85°C for three hours, and the resulting solution was cooled in an ice bath. To the mixture was added 0.13 ml of 98% formic acid followed by 0.28 ml of triethylamine. The mixture was stirred at room temperature for 30 minutes. The mixture was poured into water and the resulting mixture was extracted with diethyl ether. The organic extracts were washed successively with a saturated sodium chloride solution, a 2N hydrochloric acid solution and a saturated sodium chloride solution. The organic phase was dried over anhydrous sodium sulfate. The volatile constituents were evaporated under vacuum to yield 3.83 g (92% yield) of the crude carbamate as an oil. To a solution of the crude carbamate in 10.0 ml of DMF was added 98% formic acid (0.69 g, 14.9 mmol). The reaction solution was cooled to about 15°C under a nitrogen atmosphere. Zinc dust (1.22 g, 18.7 mmol) was next added in portions over a 30 minute period. The mixture was stirred at about 15°C for one hour and then overnight at room temperature. The reaction mixture was filtered through a sintered glass funnel and the filtrate was diluted with water. The acidic solution was made basic with excess cold ammonium hydroxide and then extracted with diethyl ether. The organic extracts were washed with water followed by a saturated sodium chloride solution. The organic phase was dried over anhydrous sodium sulfate and evaporated under vacuum. The residue was purified by preparative HPLC using a silica gel column with a methylene chloride/methanol/ammonium hydroxide (100:5:1, v:v:v) mixture as eluant to give 1.26 g (51% yield) of the free base as an oil.

The oxalate salt was prepared from the free base by treating an ethyl acetate solution of the free base with oxalic acid. The resulting precipitate was crystallized from methanol to afford colorless crystals. mp =

As noted above, the compounds of this invention are useful for inhibiting the uptake of serotonin. Therefore, another embodiment of the present invention is a method for inhibiting serotonin uptake in mammals which comprises administering to a mammal requiring increased neurotransmission of serotonin a pharmaceutically effective amount of a compound of the invention.

55 Compounds of the invention also have the ability to inhibit the uptake of norepinephrine. As such, yet another embodiment of this invention is a method for inhibiting norepinephrine uptake in mammals which comprises administering to a mammal requiring increased neurotransmission of norepinephrine a pharmaceutically effective amount of a compound of the invention.

The term "pharmaceutically effective amount", as used herein, represents an amount of a compound of the invention which is capable of inhibiting serotonin or norepinephrine uptake. The particular dose of compound administered according to this invention will of course be determined by the particular circumstances surrounding the case, including the compound administered, the route of administration, the particular condition being treated, and similar considerations. The compounds can be administered by a variety of routes including the oral, rectal, transdermal, subcutaneous, intravenous, intramuscular or intranasal routes. The compounds of the invention unexpectedly inhibit the uptake of not only serotonin but also norepinephrine in mammals. It is a special feature of the compounds that they have good oral bioavailability without losing their substantial potent inhibiting effect of serotonin and norepinephrine uptake inhibiting effect. It is also a special feature of the compounds of the present invention in that they have been found to demonstrate a low degree of toxicity to mammals. A typical daily dose will contain from about 0.01 mg/kg to about 20 mg/kg of the active compound of this invention. Preferred daily doses will be about 0.05 to about 10 mg/kg, ideally about 0.1 to about 5 mg/kg.

A variety of physiologic functions have been shown to be subject to influence by brain serotonergic and norepinephrinergic neural systems. As such, the compounds of the present invention are believed to have the ability to treat a variety of disorders in mammals associated with these neural systems such as obesity, depression, alcoholism, pain, loss of memory, anxiety and smoking. Therefore, the present invention also provides methods of treating the above disorders at rates set forth above for inhibiting serotonin and norepinephrine uptake in mammals.

The following experiment was conducted to demonstrate the ability of the compounds of the present invention to inhibit the uptake of serotonin and norepinephrine. This general procedure is set forth by Wong et al., in Drug Development Research 6:397-403 (1985).

Male Sprague-Dawley rats (110-150 g) from Harlan Industries (Cumberland, IN) were fed a Purina Chow ad libitum for at least 3 days before being used in the studies. Rats were killed by decapitation. Whole brains were removed and dissected. Cerebral cortex was homogenized in 9 volumes of a medium containing 0.32 M sucrose and 10 mM glucose. Crude synaptosomal preparations were isolated after differential centrifugation at 1,000 g for 10 min. and 17,000 g for 28 min. The final pellets were suspended in the same medium and kept in ice until use within the same day.

Synaptosomal uptake of  $^3\text{H}$ -serotonin ( $^3\text{H}$ -5-hydroxytryptamine,  $^3\text{H}$ -5HT) and  $^{14}\text{C}$ -*l*-norepinephrine ( $^{14}\text{C}$ -NE) was determined as follows. Cortical synaptosomes (equivalent to 1 mg of protein) were incubated at 37°C for 5 min in 1 ml of Krebs-bicarbonate medium containing also 10 mM glucose, 0.1 mM iproniazid, 1 mM ascorbic acid, 0.17 mM EDTA, 50 nM  $^3\text{H}$ -5HT and 100 nM  $^{14}\text{C}$ -NE. The reaction mixture was immediately diluted with 2 ml of ice-chilled Krebs-bicarbonate buffer and filtered under vacuum with a cell harvester (Brandel, Gaithersburg, MD). Filters were rinsed twice with approximately 5 ml of ice-chilled 0.9% saline and were transferred to a counting vial containing 10 ml of scintillation fluid (PCS, Amersham, Arlington Heights, IL). Radioactivity was measured by a liquid scintillation spectrophotometer. Accumulation of  $^3\text{H}$ -5HT and  $^{14}\text{C}$ -NE at 4°C represented the background and was subtracted from all samples.

The results of the evaluation of various compounds of the present invention are set forth below in Table I. In the Table, columns 1-4 identify the structure of the compounds evaluated when taken with the formula set forth in the heading; column 5 identifies the salt form, if any, of the compound evaluated; and columns 6 and 7 provide the concentration of the test compound at  $10^{-9}$  M (nM) needed to inhibit 50% of serotonin (5HT) or norepinephrine, respectively, and is indicated in the Table as  $\text{IC}_{50}$ . The numbers in parentheses represent percent inhibition at 1000 nM.

The compounds of the present invention are preferably formulated prior to administration. Therefore, yet another embodiment of the present invention is a pharmaceutical formulation comprising a compound of the invention and a pharmaceutically acceptable carrier, diluent or excipient therefor.

The present pharmaceutical formulations are prepared by known procedures using well known and readily available ingredients. In making the compositions of the present invention, the active ingredient will usually be mixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it may be a solid, semisolid or liquid material which acts as a vehicle, excipient or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosol (as a solid or in a liquid medium), ointments containing, for example,

up to 10% by weight of the active compound, soft and hard gelatin capsules, suppositories, sterile injectable solutions and sterile packaged powders.

Some examples of suitable carriers, excipients, and diluents include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water syrup, methyl cellulose, methyl and propylhydroxybenzoates, talc, magnesium stearate and mineral oil. The formulations can additionally include lubricating agents, wetting agents, emulsifying and suspending agents, preserving agents, sweetening agents or flavoring agents. The compositions of the invention may be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures well known in the art.

The compositions are preferably formulated in a unit dosage form, each dosage containing from about 5 to about 500 mg, more usually about 25 to about 300 mg, of the active ingredient. The term "unit dosage form" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical carrier.

The following formulation examples are illustrative only and are not intended to limit the scope of the invention in any way.

#### 20 Formulation 1

Hard gelatin capsules are prepared using the following ingredients:

|   | Quantity<br>(mg/capsule) |
|---|--------------------------|
| (+)-N-methyl-3-(1-naphthalenyloxy)-<br>3-(2-thienyl)propanamine maleate | 250                      |
| starch, dried   | 200                      |
| magnesium stearate  | 10                       |
| Total   | 460 mg                   |

35 The above ingredients are mixed and filled into hard gelatin capsules in 460 mg quantities.

#### Formulation 2

40 A tablet is prepared using the ingredients below:

|  | Quantity<br>(mg/tablet) |
|--|-------------------------|
| N,N-dimethyl-3-(1-naphthalenyloxy)-3-<br>(5-chloro-2-thienyl)propanamine oxalate | 250                     |
| cellulose, microcrystalline  | 400                     |
| silicon dioxide, fumed   | 10                      |
| stearic acid   | 5                       |
| Total  | 665 mg                  |

55 The components are blended and compressed to form tablets each weighing 665 mg.

Formulation 3

An aerosol solution is prepared containing the following components:

5

10

15

Weight %

3-(1-naphthalenyloxy)-3-(2-thiazoyl)-  
propanamine hydrochloride

0.25

ethanol

29.75

Propellant 22  
(chlorodifluoromethane)

70.00

Total

100.00

The active compound is mixed with ethanol and the mixture added to a portion of the propellant 22, cooled to -30°C. and transferred to a filling device. The required amount is then fed to a stainless steel container and diluted with the remainder of the propellant. The valve units are then fitted to the container.

20

Formulation 4

Tablets each containing 60 mg of active ingredient are made as follows:

25

N,N-dimethyl-3-[4-(trifluoromethyl)phen-  
oxy]-3-(3-thienyl)propanamine oxalate

60 mg

starch

45 mg

30

microcrystalline cellulose

35 mg

polyvinylpyrrolidone  
(as 10% solution in water)

4 mg

sodium carboxymethyl starch

4.5 mg

35

magnesium stearate

0.5 mg

talc

1 mg

Total

150 mg

40

45

The active ingredient, starch and cellulose are passed through a No. 45 mesh U.S. sieve and mixed thoroughly. The solution of polyvinylpyrrolidone is mixed with the resultant powders which are then passed through a No. 14 mesh U.S. sieve. The granules so produced are dried at 50°C and passed through a No. 18 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate and talc, previously passed through a No. 60 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on a tablet machine to yield tablets each weighing 150 mg.

50

55

Formulation 5

Capsules each containing 80 mg of medicament are made as follows:

|    |   |             |
|----|---|-------------|
| 5  | N,N-dimethyl-3-[4-(trifluoromethyl)phenoxy]-<br>3-(2-furanyl)propanamine hydrobromide | 80          |
|    | starch  | 59 mg       |
| 10 | microcrystalline cellulose  | 59 mg       |
|    | magnesium stearate  | <u>2 mg</u> |
|    | Total   | 200 mg      |

15 The active ingredient, cellulose, starch and magnesium stearate are blended, passed through a No. 45 mesh U.S. sieve, and filled into hard gelatin capsules in 200 mg quantities.

20 Formulation 6

Suppositories each containing 225 mg of active ingredient may be made as follows:

|    |   |                 |
|----|---|-----------------|
| 25 | N-methyl-3-(2-naphthalenyloxy)-3-<br>(2-thienyl)propanamine maleate | 225 mg          |
|    | saturated fatty acid glycerides                                     | <u>2,000 mg</u> |
|    | Total   | 2,225 mg        |

30 The active ingredient is passed through a No. 60 mesh U.S. sieve and suspended in the saturated fatty acid glycerides previously melted using the minimum heat necessary. The mixture is then poured into a suppository mold of nominal 2 g capacity and allowed to cool.

35 Formulation 7

Suspensions each containing 50 mg of medicament per 5 ml dose are made as follows:

|    |   |         |
|----|---|---------|
|    | N,N-dimethyl-3-(4-chlorophenoxy)-3-(2-thienyl)propanamine succinate | 50 mg   |
| 40 | sodium carboxymethyl cellulose                                      | 50 mg   |
|    | syrup   | 1.25 ml |
|    | benzoic acid solution   | 0.10 ml |
|    | flavor  | q.v.    |
|    | color   | q.v.    |
| 45 | purified water to total   | 5 ml    |

The medicament is passed through a No. 45 mesh U.S. sieve and mixed with the sodium carboxymethyl cellulose and syrup to form a smooth paste. The benzoic acid solution, flavor and color are diluted with some of the water and added, with stirring. Sufficient water is then added to produce the required volume.

50

Formulation 8

An intravenous formulation may be prepared as follows:

|    |  |         |
|----|--|---------|
| 55 | N-methyl-3-(1-naphthalenyloxy)-3-(3-methyl-2-thienyl)propanamine acetate | 100 mg  |
|    | isotonic saline  | 1000 ml |

The solution of the above ingredients is administered intravenously at a rate of 1 ml per minute to a subject suffering from depression.

## Claims

1. A compound of the formula (I):

wherein:

R<sup>1</sup> is C<sub>5</sub>-C<sub>7</sub> cycloalkyl, thienyl, halothienyl, (C<sub>1</sub>-C<sub>4</sub>alkyl)thienyl, furanyl, pyridyl or thiazolyl;

each of R<sup>2</sup> and R<sup>3</sup> independently is hydrogen or methyl;

each R<sup>4</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>3</sub> alkoxy or trifluoromethyl;

each R<sup>5</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl or trifluoromethyl;

m is 0, 1 or 2;

n is 0 or 1; or

a pharmaceutically acceptable acid addition salt thereof.

2. A compound of Claim 1 wherein Ar is

3. A compound of Claim 1 or 2 wherein R<sup>1</sup> is thienyl.

4. A compound of any one of Claims 1 to 3 wherein one of R<sup>2</sup> and R<sup>3</sup> is hydrogen and the other is methyl.

5. N-Methyl-3-(1-naphthalenyloxy)-3-(2-thienyl)propanamine, or a pharmaceutically acceptable acid addition salt thereof.

6. The compound of Claim 5 which is the (+)-stereoisomer.

7. (+)-N-Methyl-3-(1-naphthalenyloxy)-3-(2-thienyl)propanamine maleate.

8. A pharmaceutical formulation comprising a compound of formula (I) as claimed in any one of Claims 1 to 7, or a pharmaceutically acceptable acid addition salt thereof, associated with one or more pharmaceutically acceptable carriers, diluents or excipients therefor.

9. A compound of formula (I), or a pharmaceutically acceptable salt thereof, for use in inhibiting the uptake of serotonin and norepinephrine in mammals.

10. A process for preparing a compound of formula (I), or a pharmaceutically acceptable salt thereof as claimed in any one of Claims 1 to 7 which comprises:

(A) reacting a compound of the formula

with a reagent of the formula Y-Ar, wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and Ar are as defined in Claim 1 and one of X and Y is hydroxy and the other is a good leaving group, in the presence of a base strong enough to generate the anion of the hydroxy containing compound; or

(B) the demethylation of a compound of Formula (I) wherein both of R<sup>2</sup> and R<sup>3</sup> are methyl so as to provide a compound of Formula (I) in which one of R<sup>2</sup> and R<sup>3</sup> is hydrogen and the other is methyl;

(C) reaction (A) or (B) being optionally followed, if necessary, by salification to form a pharmaceutically acceptable acid addition salt.

Claims for the following Contracting States: SPAIN, GREECE

1. A process for preparing a compound of the formula (I):

wherein:

R<sup>1</sup> is C<sub>5</sub>-C<sub>7</sub> cycloalkyl, thienyl, halothienyl, (C<sub>1</sub>-C<sub>4</sub> alkyl)thienyl, furanyl, pyridyl or thiazolyl;

each of R<sup>2</sup> and R<sup>3</sup> independently is hydrogen or methyl;

each R<sup>4</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>3</sub> alkoxy or trifluoromethyl;

each R<sup>5</sup> independently is halo, C<sub>1</sub>-C<sub>4</sub> alkyl or trifluoromethyl;

m is 0, 1 or 2;

n is 0 or 1; or

a pharmaceutically acceptable acid addition salt thereof which comprises:

(A) reacting a compound of the formula

with a reagent of the formula Y-Ar, wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and Ar are as defined in Claim 1 and one of X and Y is hydroxy and the other is a good leaving group, in the presence of a base strong enough to generate the anion of the hydroxy containing compounds; or

(B) the demethylation of a compound of Formula (I) wherein both of R<sup>2</sup> and R<sup>3</sup> are methyl so as to provide a compound of Formula (I) in which one of R<sup>2</sup> and R<sup>3</sup> is hydrogen and the other is methyl;

(C) reaction (A) or (B) being optionally followed, if necessary, by salification to form a pharmaceutically acceptable acid addition salt.

2. A process of Claim 1 wherein Ar is

3. A process of Claim 1 or 2 wherein  $R^1$  is thienyl.
4. A process of any one of Claims 1 to 3 wherein one of  $R^2$  and  $R^3$  is hydrogen and the other is methyl.
5. A process of Claim 1 for preparing N-methyl-3-(1-naphthalenyloxy)-3-(2-thienyl)propanamine, or a pharmaceutically acceptable acid addition salt thereof.
6. A process of Claim 5 for preparing the (+)-stereoisomer.
